

TAS Schäfer two-part shrink disc now available with "block design"

Since 01/06/2016 TAS Schäfer provides the 2-part shrink discs also in the "block design". In the clamping-process with distance-controlled assembly a torque wrench is not necessary. So the clamping-process is much easier and faster. The clamping screws can be tightened uniformly in a clockwise sequence until the front faces of the pressure ring and the bush are flush (see drawing). The radial clamping force is generated by the conical surfaces. When this condition is reached, the torque can be reliably transmitted between hub (hollow shaft) and shaft.

If you need further information do not hesitate to contact the team of TAS Schäfer.
